

PCI-12

Injection control panel

Properties:

The Belloli PCI-12 panel is an instrument used to control the parameters of injection operated on injection anchors, tie rods as well as micropiles.

The function of the PCI-12 panel is to memorize the quantity, the mix of mortar, the injection pressure and the ratio used, between water and mortar for the injection of every single anchor.

At the end of each shift or work, the registrations are memorized on a normal USB stick and transferred to a computer.

The PCI-12 panel is used in general together with our BELCEM 3012 pump, but it can be operated with any other pump.

The maximum capacity to be registered is 4000 l/h

The maximum pressure is 60 bar

Higher capacities and pressures are available on request
